

Firefox:

I opened the Elder Miss Peaks Resort homepage in Firefox and noticed a couple of things. First, the colors were much brighter and really stood out, which is an advantage as it made the scenic photographs on the webpage pop—definitely a great selling point for the resort. Secondly, the fonts appeared thicker compared to those in Chrome. While it wasn't a major issue, I found it a bit odd. Thirdly, beneath the form, the red stars were quite noticeable, but in the "Preferred Method of Contact" section, the circles for the radio buttons were not perfectly centered. Again, this isn't a dealbreaker. Additionally, when you click the submit button without filling out all the fields, a blue error message appears, stating "Please fill out this form." In Chrome and Edge, this message is located right next to the button you clicked.

Edge (Microsoft Edge):

While trying to open a website in Microsoft Edge, I discovered that I couldn't right-click in Visual Studio Code to automatically open the site. Instead, I had to copy and paste the website address into Edge to access it. To enable this functionality, I had to install a Microsoft Edge extension in Visual Studio Code. After that, I went to the terminal and typed the location path to the folder where I stored the files. I noticed that anything wrapped in `<nav>` had a night blue color that appeared much lighter than intended. The colors in Edge were brighter than in Chrome but not overly bright or saturated like they appeared in Firefox. On both Chrome and Firefox, the graphics extended to the edges of the window, but in Edge, they seemed to have rounded corners. I opened a few websites with solid backgrounds, and they displayed the same way. In Chrome and Firefox, the graphics reached the edges, while in Edge, they again had rounded corners. Additionally, I found that the address bar in Chrome and Firefox includes `file:///` before the web address, while Edge does not. Instead, Edge displays a circle with an eye icon followed by `file|` which I found quite strange. Overall, Edge is quite similar to Chrome, and I didn't notice many significant differences apart from what I've mentioned.
